

Pouch Villa Platform Guide

How to run your shop — products, orders, payments and staff.

Written by Bespoke Technologies

Version 1.0

Five things to set before you sell

The platform ships with nothing invented. Where you have not supplied a fact, the site says so plainly rather than showing a made-up one. That is deliberate, and it means five settings decide whether the shop can trade.

All of them live in **Admin** → **Settings**, and you can change any of them yourself at any time. Nothing here needs us.

You do not have to remember this page. Your dashboard shows a **Before you open** list naming whatever is still missing, with the ones that stop a sale marked and listed first. Each row links straight to the screen that fixes it, and the whole list disappears once nothing is left.

What	Where it shows	If you leave it
Bank account name, number, bank	The payment screen after checkout	Customers cannot pay. The page says the account has not been confirmed.
Delivery zones area and fee	Checkout totals	No delivery fee is added to an order.
Store address and opening hours	Home page and Contact	Both read “not confirmed yet”.
WhatsApp and contact email	Contact page	Customers have no way to reach you.
Policy pages About, Returns, Privacy, Terms	Footer links	Each page shows a placeholder notice.

The one that stops sales

Until the bank account is filled in, a customer can add to cart, check out and place an order — then reach a payment screen with no account to pay into. Set this first. It sits at the top of the dashboard list until you do.

Signing in, and adding your team

There are three access levels and no more: **CEO**, **Manager** and **Staff**. Nothing is seeded — every account, including yours, exists because somebody redeemed a role code.

Adding a staff member

Go to **Admin** → **Staff**, choose the access level, and press **Create code**. The code appears once.

- **Copy code** puts the eight characters on your clipboard.
- **Copy invite** gives you a ready message with the link and the code in it.
- **Share** opens your phone's share sheet — one tap into WhatsApp.

They open the link, type the code into the eight boxes, and set their own name, email and password. The code is single use by default and expires.

What each level can do

Level	Can do
CEO	Everything, including staff, roles and permissions.
Manager	Whatever the CEO grants — set under Roles & Permissions.
Staff	Whatever the CEO grants. Usually orders and products.

Two things worth knowing

Permissions are yours to change at runtime. Roles & Permissions is a list of switches, not something we have to rebuild for you.

Suspending someone ends their access immediately. The last CEO cannot be suspended or removed, so the shop can never lock itself out.

If your counter people are on the Staff level

Recording a payment needs the same permission as approving a transfer receipt, and the Staff level does not have it to start with. If the person on your counter is Staff, open **Admin** → **Roles**, choose Staff and switch on the payment permission. You can do that yourself, and change it back whenever you like.

PRODUCTS

Putting something in the shop

Admin → **Products** → **Add product**. One screen, top to bottom, and it publishes when you press the button.

Field	What to put
Product name	What a customer would call it. The web address comes from this.
Pictures	One to five. The first one is the card image.
Price	In naira. Required to publish — a shop cannot sell something with no price.
Opening stock	How many you have right now.
Description	Shown on the product page and used by search.
Brand	The make. Choosing it narrows everything below.
Device class	Optional. Narrows the model list — iPhone, iPad.
Categories	Where it sits in the shop.
Fits these devices	Tick the models it fits. Leave blank if it fits anything.

At the bottom you choose **Publish it now** or **Save as a draft**. Publishing is the default. A draft is visible only to staff.

Why the price is required

Publishing without one would put a product in front of a customer that they cannot buy. Save it as a draft instead and add the price later.

Brands, categories, devices and classes

Four lists shape how customers find things. They are separate on purpose.

List	What it means	Where the customer sees it
Categories	What a thing <i>is</i> — Pouches, Accessories.	The two cards on the home page, and the shop filter.
Brands	The make — Apple, Samsung.	Step one of the browse path, carried by the logo.
Devices	The models an accessory fits. Not things you sell.	“Find what fits your device”, and each product page.
Device classes	Optional grouping of models under a make.	Headings inside the model list — iPhone, iPad.

Device classes

Add these under **Admin** → **Devices** → **Device classes** when a make has enough models that one list is hard to read. Apple becomes iPhone and iPad; Samsung becomes Galaxy and Galaxy Tab.

- Entirely optional. A make with no classes shows its models flat, as before.
- The sort order you set is the order customers see, everywhere.
- Removing a class keeps its models — they simply become unfiled.

Brand logos

Set a logo on a brand under Brands & Categories. The browse step is carried by these marks — a shopper finds the Apple logo faster than they read the word. A brand with no logo draws its initial instead.

ORDERS

From placed to delivered

Customers pay in one of two ways: by transfer before they get the goods, or in the shop when they collect. Your job is the same either way — confirm the money, then move the order along.

Paying by transfer

Step	Who	Where
1. Order placed	Customer	They get a reference and your bank details.
2. Transfer made	Customer	They upload the receipt on the order page.
3. Proof checked	You	Admin → Payments & Proofs — approve or reject.
4. Packed and sent	You	Admin → Orders — move the status along.

A customer tracks their own order with the reference and the phone number they gave. Both are required — a reference alone travels in a bank transfer, and it should not be enough to open somebody's address.

Paying in the shop

A customer who chooses to collect can say they will pay when they arrive, and whether that will be cash, the POS, or a transfer they make at the counter. They are not shown your bank details or asked for a receipt for money they have not sent.

You are emailed when one of these is placed, with the reference, the phone number, what they said they would pay with and when they said they were coming. The same orders are listed under **Coming in to pay** on the Payments screen, soonest first.

When they walk in	What you do
They give you the reference	Search it in the admin, or scan the QR on their receipt.
You take the money	Press Take payment , tap Cash, POS or Transfer, press Record payment.
That is it	The order is confirmed, the customer is emailed, and the till record says what you actually took.

Tap whatever they really paid with, not what they picked online. Somebody who chose cash and then used the POS is recorded as POS — that is what makes the day's takings add up.

Payment proofs are financial documents

They hold bank details, so they are stored privately and every time one is opened it is recorded. Open them inside the admin rather than sharing a link to one.

Arranging what customers see first

The home page is yours to arrange under **Admin** → **Storefront**. Until you add a section, it shows your latest products automatically.

What you can change

- **Headline** and the line under it — Settings, under the storefront group.
- **Announcement bar** — one short line across the top. Leave it empty to hide it.
- **Category pictures** — set a photo per category under Brands & Categories.
- **Sections** — pick products by hand, or let a category fill itself.

A section can be a plain grid, a feature with one product leading, or a tinted band. Mixing them is what stops a long page reading as one wall.

Reviews and enquiries

- Anyone can leave a review. Nothing appears until you approve it under **Reviews**.
- Messages from the contact form land in **Contact Requests**, and are emailed to your operations inbox.

Running the shop from your phone

The admin is built for a phone first, because that is how you told us you work. Everything below is designed to be done one-handed.

To do this	Go here
Add a product	Products → Add product
Check a payment	Payments & Proofs
Move an order along	Orders → open it → change status
Add a staff member	Staff → Create code → Share
Change the bank details	Settings
Approve a review	Reviews
See how the shop looks	Menu → View store

Signed in to the admin, viewing the shop

A red bar across the top of the storefront tells you that you are signed in to the admin, with a link back. It is visible only to you.

It does not sign you in as a customer. To place a real order yourself, sign in to the shop with your own customer account.

SAFETY

What the platform protects you from

Some of this is invisible until you need it. It is worth knowing it is there.

Nothing is really deleted	Products, orders, customers and reviews are hidden and kept, with a record of who removed them and why.
Every change is recorded	Who did it, what changed, and when. This is how a disagreement about an order gets settled.
Prices are frozen on an order	Changing a price today never changes what a past customer was charged.
Staff and customers are separate	A customer account can never reach the admin, whatever happens on the shop side.
Stock is a history, not a number	Every movement is a line you can trace, so a wrong figure can be explained rather than guessed at.

IF SOMETHING LOOKS WRONG

The four we are asked about most

A product is not in the shop

Open it and look at the bar at the top. If it says **Not visible to customers** it is a draft — press **Publish**. If Publish is greyed out, it has no price.

A customer says they cannot pay

Check **Settings** for the bank account name, number and bank. If any is blank the payment screen has nothing to show.

Nothing appears under “what fits my device”

The finder only lists models you have entered under **Devices**, and only products you have ticked against them. Add the model first, then tick it on the product.

A staff code will not work

Codes are single use by default and they expire. Issue a fresh one — it costs nothing. Type the letters only; the dash is not part of the code.

Before you call us

Note what you were doing, what you expected, and what happened instead. A screenshot of the screen with the problem on it usually answers the first three questions we would ask.

HANDOVER

What is done, and what is waiting on you

The platform is complete and running. What remains is content only — facts we will not invent on your behalf.

Waiting on you

Item	Until then
Bank account for transfers	Customers cannot complete a payment.
Delivery zones and fees	No delivery fee is added at checkout.
Store address and opening hours	The home page says they are not confirmed.
WhatsApp and contact email	The contact page has no way to reach you.
About, Returns, Privacy, Terms	Those pages show a placeholder.
Vector logo and exact brand colours	We use the red sampled from your artwork.

One decision left open

When you are signed in to the admin and you open the shop, it shows that you are staff but does not sign you in as a customer. Whether one sign-in should do both is a security trade-off, and it is yours to make. Ask us and we will walk you through what changes.

Bespoke Technologies

Built for Pouch Villa. This guide covers the platform as handed over.
